What the fills say

Across the 120 settled fills our venue model covers (8 more sit in corridors we do not price, see below), \$69,727,500 of stablecoin-FX notional between 2026-06-17 and 2026-09-13, Sample PSP paid a volume-weighted all-in cost of **31.4 bps**. The cheapest single venue that would have accepted each of those tickets, on its own measured, published or modeled rate, comes to **12.7 bps**.

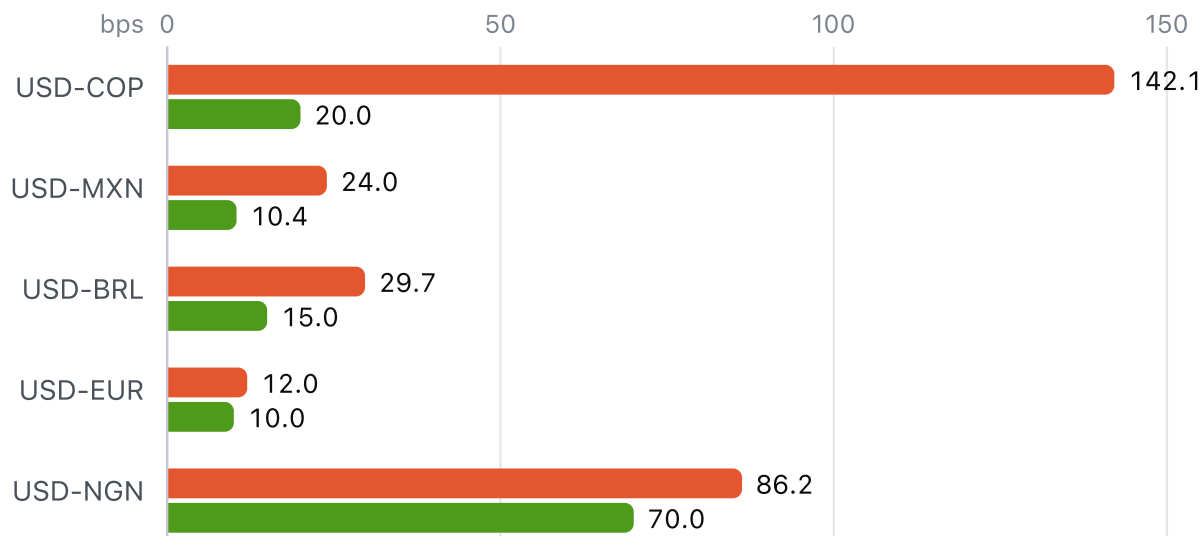

That gap is **18.7 bps**, or **\$130,193** over the period, which is \$533,939 a year at this run-rate. It requires no new technology to capture: it is the cost of sending each ticket to a different venue you could already onboard.

The concentration is not spread evenly. **USD-COP** alone accounts for \$82,307 of it, on \$6,740,700 routed at 142.1 bps against a best-available 20.0 bps, with 63% of that corridor's volume sitting with Koywe.

Splitting each ticket across venues rather than picking the single best one adds a further \$3 (0.0 bps). On this book the routing itself is the smaller half of the prize; the larger half is venue choice.

Cost by corridor

What you paid Best available single venue

CORRIDOR	FILLS	NOTIONAL	YOU PAID	BEST VENUE	BEST SPLIT	GAP	STATUS
USD-COP	22	\$6,740,700	142.1 bps	20.0 bps	20.0 bps	\$82,307	▲ actionable
USD-MXN	34	\$15,590,100	24.0 bps	10.4 bps	10.4 bps	\$21,124	▲ actionable
USD-BRL	26	\$12,661,200	29.7 bps	15.0 bps	15.0 bps	\$18,596	▲ actionable
USD-EUR	20	\$33,896,600	12.0 bps	10.0 bps	10.0 bps	\$6,803	● at market
USD-NGN	18	\$838,900	86.2 bps	70.0 bps	70.0 bps	\$1,363	▲ actionable

“Gap” is what you paid minus the best single venue that would have accepted the same ticket, summed over the fills in that corridor. Signed: a corridor where you beat the model shows a negative gap. “Actionable” marks a corridor at or above the 10 bps bar we use to decide a corridor is worth changing.

What to do about it

Concretely, over this period: moving the tickets below to the cheaper venue named would have saved **\$121,070** across 4 corridors, each a venue that would already have accepted that exact ticket, on its own rate. No routing technology, just a different destination. Splitting tickets across venues on top of that adds \$3 more.

USD-COP: \$82,307 addressable (122.1 bps)

MOVE TO	WHICH TICKETS	RATE	NOTIONAL	SAVING
Circle StableFX (RFQ/Arc) estimate	22 tickets, \$100k–\$678k (median \$282k) now via Koywe (\$4.2M), OTC Desk A (\$2.5M)	142.1 bps → 20.0 bps	\$6,740,700	\$82,307

USD-MXN: \$21,124 addressable (13.5 bps)

MOVE TO	WHICH TICKETS	RATE	NOTIONAL	SAVING
Circle StableFX (RFQ/Arc) estimate	29 tickets, \$214k–\$1.1M (median \$484k) now via Bitso Business (\$9.4M), Circle StableFX (\$5.8M)	24.4 bps → 12.0 bps	\$15,178,200	\$18,756
Etherfuse (MXNe off-ramp) sourced	5 tickets of \$55k, \$67k, \$88k, \$94k, \$108k now via Etherfuse (\$412k)	9.2 bps → 8.0 bps	\$411,900	\$48

USD-BRL: \$18,596 addressable (14.7 bps)

MOVE TO	WHICH TICKETS	RATE	NOTIONAL	SAVING
Circle StableFX (RFQ/Arc) estimate	26 tickets, \$122k–\$1.1M (median \$480k) now via Bitso Business (\$7.5M), OTC Desk A (\$5.1M)	29.7 bps → 15.0 bps	\$12,661,200	\$18,596

Router work: a further \$3 is available on the movable tickets by splitting each across venues instead of sending it to one. That is the pre-trade product, not a phone call.

USD-NGN: \$1,363 addressable (16.2 bps)

MOVE TO	WHICH TICKETS	RATE	NOTIONAL	SAVING
Yellow Card (NGN off-ramp) estimate	18 tickets, \$22k–\$72k (median \$45k) now via Yellow Card (\$839k)	86.2 bps → 70.0 bps	\$838,900	\$1,363

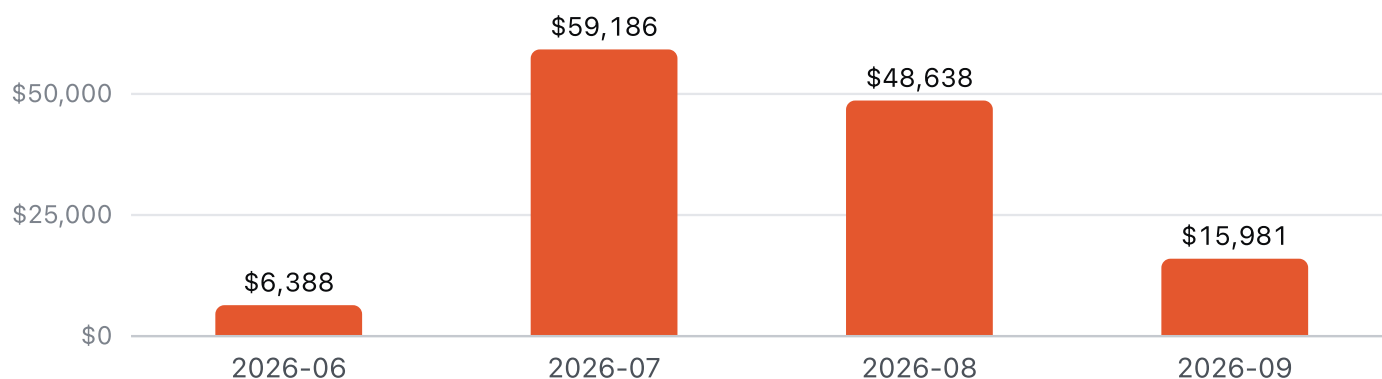

“Rate” is the volume-weighted cost you paid on these tickets versus the target venue's rate for the same sizes. Only tickets where you paid more than the target are listed. A fill already at the best venue is left alone. Savings are the period's realized gap, not a forward projection.

This is the past. The sheet is the future. The moves above are what these particular tickets should have done. The standing rule for the *next* ticket (which venue, or which split, for every size

band in every corridor) is the routing instruction sheet, built from the same export.

Is it getting better or worse?

Addressable cost gap, by month

MONTH	FILLS	NOTIONAL	YOU PAID	BEST VENUE	GAP	GAP (BPS)
2026-06	14	\$8,225,400	21.7 bps	13.9 bps	\$6,388	7.8 bps
2026-07	44	\$31,756,600	30.6 bps	12.0 bps	\$59,186	18.6 bps
2026-08	46	\$24,909,400	32.5 bps	12.9 bps	\$48,638	19.5 bps
2026-09	16	\$4,836,100	46.9 bps	13.9 bps	\$15,981	33.0 bps

The first and last months are partial (the export starts 2026-06-17 and ends 2026-09-13), so read the bps column, not the dollar column, when comparing months.

Where the volume sits

PROVIDER	CORRIDORS	FILLS	NOTIONAL	YOU PAID	BEST VENUE	GAP
Koywe	USD-COP	16	\$4,222,700	167.2 bps	20.0 bps	\$62,142
Bitso Business	USD-BRL, USD-MXN	37	\$16,954,200	32.4 bps	12.4 bps	\$33,973
OTC Desk A	USD-COP, USD-BRL	15	\$7,650,500	48.0 bps	16.6 bps	\$23,953
OTC Desk B	USD-EUR	8	\$14,765,400	13.1 bps	10.0 bps	\$4,589
Kraken	USD-EUR	12	\$19,131,200	11.2 bps	10.0 bps	\$2,215
Circle StableFX	USD-MXN	9	\$5,752,700	14.1 bps	10.7 bps	\$1,911
Yellow Card	USD-NGN	18	\$838,900	86.2 bps	70.0 bps	\$1,363
Etherfuse	USD-MXN	5	\$411,900	9.2 bps	8.0 bps	\$48

Concentration by corridor: USD-COP 63% with Koywe · USD-MXN 60% with Bitso Business · USD-BRL 59% with Bitso Business · USD-EUR 56% with Kraken · USD-NGN 100% with Yellow Card. A corridor served by one provider has no price discovery in it. The quote you get is the only quote you see.

The ten most expensive individual fills

REF	DATE	CORRIDOR	PROVIDER	NOTIONAL	YOU PAID	BEST VENUE	WHICH VENUE	GAP

Corridors outside the analysis

These corridors have no lane in our venue model, so no counterfactual was computed for them. Their notional is excluded from every figure above rather than being scored against a guess.

CORRIDOR	FILLS	NOTIONAL	YOU PAID
USD-PEN	8	\$889,700	103.5 bps

Method, and what is modeled

Every fill is priced against three reference points computed from the same venue model and router that drive our pre-trade product, not against a marketing table:

- **Best single venue:** the cheapest one venue in that corridor whose minimum ticket accepts that fill, at its own rate for that size. This is the conservative counterfactual and the one the headline uses.
- **Best split route:** what our router achieves splitting the same ticket across venues, sending each increment to whichever venue is cheapest at the margin (on-chain venues get more expensive as you fill them).
- **Composite benchmark:** a published corridor median where one exists, otherwise an explicitly labelled proxy. We do not present a proxy as a published index.

VENUES USED AS THE COUNTERFACTUAL

LANE	VENUE	TYPE	RATE PROVENANCE
circle_stablefx_brl	Circle StableFX (RFQ/Arc)	circle_stablefx	estimate
otc_eur	OTC (G10 desk)	otc	estimate
offramp_yellowcard_ngn	Yellow Card (NGN off-ramp)	offramp	estimate
circle_stablefx_cop	Circle StableFX (RFQ/Arc)	circle_stablefx	estimate
offramp_etherfuse_mxn	Etherfuse (MXNe off-ramp)	offramp	sourced

“live · measured” means the rate was read from the venue's own public API at the time stamped below, at the ticket sizes shown. “sourced” means the rate comes from the venue's own published schedule or documentation. “estimate” means that venue does not publish its pricing and the figure is a stated mid-pack model, not a quote.

LIVE VENUE QUOTES BEHIND THIS REPORT

These lanes were priced from the venue's own public API at 2026-09-16T02:20:07.149Z (snapshot live-quotes-2026-09-16T02-20-07Z.json, re-runnable). Each rate is the venue's all-in cost at that ticket size against an independent fair rate: walk-the-book impact plus the published fee for the exchange lane; the realised swap rate against the fiat reference for the on-chain lanes. A fill is priced by interpolating between the sizes quoted. The *ceiling* is the largest size the venue could actually fill at a usable cost when we looked; above it the venue is not offered as a counterfactual and the router will not send it more. No order was placed and nothing signed.

LANE	VENUE	CORRIDOR	ALL-IN BPS BY TICKET SIZE	CEILING	FAIR RATE	ROLE
