missing*

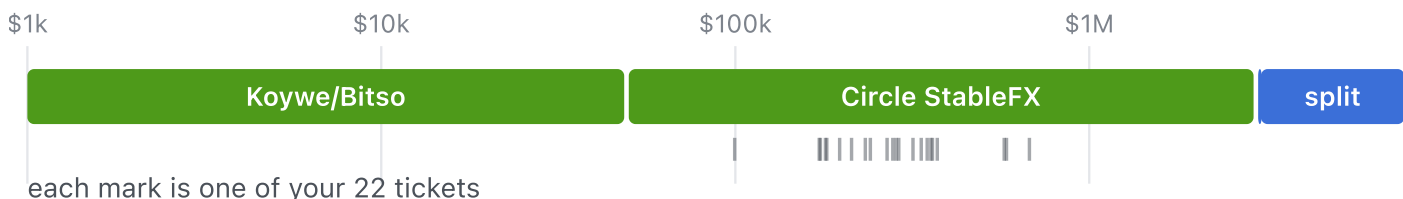

How to use this

- 1 Find the corridor, then the row whose **ticket size** range contains the ticket.
- 2 Follow **Send it**. One venue means one ticket for the whole size. A split names the venues and the order to fill them in.
- 3 For a split, ask us for the exact legs for that ticket size and we'll send the fill order with clip sizes.
- 4 Your desk places every trade on its own credentials. We quote, route and score; we never execute.

What a band promises. Inside a band, the instruction is never more than 0.5 bps worse than re-deciding the venue for that exact ticket. That tolerance is the whole point: without it, the theoretically-cheapest venue flips every few thousand dollars in the narrow windows just above a venue's maximum ticket, and the sheet becomes forty rows nobody can follow.

USD-COP

22 of your 22 tickets sit in a band where a different venue is cheaper: \$82,307 over the period, 122.1 bps of the corridor's notional.

\$8,150,001 – \$8,250,000	Split across 4 venues estimate live · measured Split across Circle StableFX (RFQ/Arc) + Bitso (BRL off-ramp) + KyberSwap USDC→wBRL (Base) + OTC (Finery/Wintermute-class), legs priced by the router	18.3–21.6 bps	—	—	—	no flow here yet

Above \$8,250,000 this corridor cannot be filled in one go even using every venue at once. Tranche a larger ticket across dealing windows.

USD-EUR

20 of your 20 tickets sit in a band where a different venue is cheaper: \$6,803 over the period, 2.0 bps of the corridor's notional.

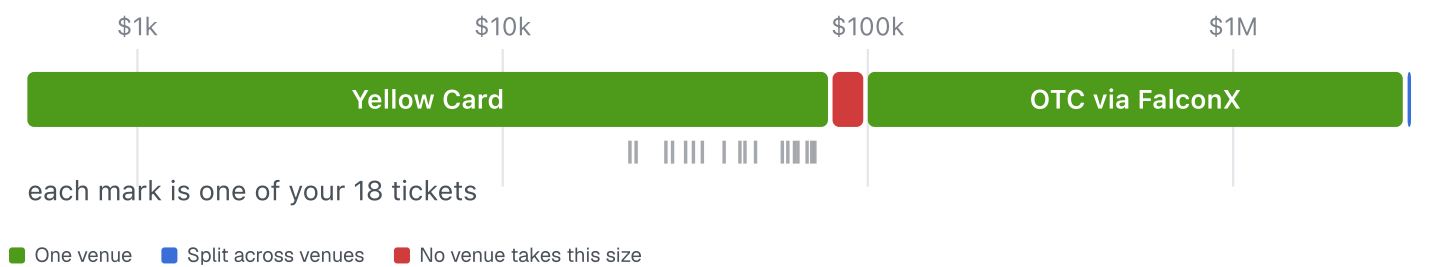

TICKET SIZE	SEND IT	EXPECTED ALL-IN	YOUR FLOW HERE	YOU PAID	WOULD SAVE	VERDICT
\$10 – \$99	LI.FI-aggregated on-chain route live · measured one ticket, whole size · venue takes \$10–\$2M · settles in 15s	26.0 bps	—	—	—	no flow here yet
\$100 – \$249,999	Kraken self-serve book live · measured one ticket, whole size · venue takes \$100–\$2M · settles in 5s	20.3–20.9 bps	—	—	—	no flow here yet
\$250,000 – \$5,000,000	OTC (G10 desk) estimate one ticket, whole size · venue takes \$250k–\$5M · settles in 30s	10.0 bps	20 tickets \$33,896,600 · \$355k–\$2.8M	12.0 bps	\$6,803	▲ move this flow
\$5,000,001 – \$5,553,938	Split across 2 venues live · measured estimate Split across Kraken self-serve book + OTC (G10 desk), legs priced by the router	10.0–11.8 bps	—	—	—	no flow here yet
\$5,553,939 – \$9,000,000	Split across 3 venues live · measured estimate Split across Kraken self-serve book + LI.FI-aggregated on-chain route + OTC (G10 desk), legs priced by the router	11.3–61.6 bps	—	—	—	no flow here yet

Above \$9,000,000 this corridor cannot be filled in one go even using every venue at once. Tranche a larger ticket across dealing windows.

USD-NGN

18 of your 18 tickets sit in a band where a different venue is cheaper: \$1,363 over the period, 16.2 bps of the corridor's notional.

TICKET SIZE	SEND IT	EXPECTED ALL-IN	YOUR FLOW HERE	YOU PAID	WOULD SAVE	VERDICT
\$500 – \$80,000	Yellow Card (NGN off-ramp) estimate one ticket, whole size · venue takes \$500–\$80k · settles in 5 min	70.0 bps	18 tickets \$838,900 · \$22k–\$72k	86.2 bps	\$1,363	▲ move this flow
\$80,001 – \$99,999	No venue takes this size falls in the gap between two venues: Yellow Card (NGN off-ramp) stops at \$80,000 and OTC via FalconX (18-fiat desk) does not start until \$100,000	—	—	—	—	no venue
\$100,000 – \$3,000,000	OTC via FalconX (18-fiat desk) estimate one ticket, whole size · venue takes \$100k–\$3M · settles in 30s	35.0 bps	—	—	—	no flow here yet
\$3,000,001 – \$3,080,000	Split across 2 venues estimate Fill in order: OTC via FalconX (18-fiat desk) up to \$3M, then Yellow Card (NGN off-ramp) takes the remainder	35.0–35.9 bps	—	—	—	no flow here yet

Above \$3,080,000 this corridor cannot be filled in one go even using every venue at once. Tranche a larger ticket across dealing windows. A ticket between \$80,001 and \$99,999 has nowhere to go: falls in the gap between two venues: Yellow Card (NGN off-ramp) stops at \$80,000 and OTC via FalconX (18-fiat desk) does not start until \$100,000. Send \$80,000 to Yellow Card (NGN off-ramp) and carry the rest, or hold the ticket until it clears \$100,000.

Venue relationships you are missing

8 of your tickets (\$889,700, on which you paid \$9,206) have **no instruction anywhere on this sheet**: under the venue set above there is no venue, or no combination of venues, that would take them. They are not a routing problem, they are a relationship problem, so they are listed here rather than hidden in a footnote.

CORRIDOR	STRANDED TICKETS	NOTIONAL	WHY IT HAS NO INSTRUCTION	WHAT WOULD FIX IT	WORTH OVER THE PERIOD
USD-PEN Outside our coverage	8 \$42,700–\$149,200	\$889,700 103.5 bps paid to LatamPay	no venue in our set covers this corridor at any size	no venue we price serves this corridor	—

The saving is measured the same way as every other figure here: the sheet rebuilt with that venue added back, its bands applied to these exact tickets, against what you actually paid on them. A corridor marked *outside our coverage* has no lane in our venue set at any size. We cannot name the venue for you, but the flow is real and priced here so you can see what it is costing.

What this sheet would have done to your last 89 days

Every ticket in the export re-priced under the band it falls into. Not re-optimised per ticket, but priced under the standing instruction as written, which is what a desk would actually have done.

CORRIDOR	TICKETS	NOTIONAL	YOU PAID	UNDER THIS SHEET	MOVE	HOLD	SAVING
USD-COP	22	\$6,740,700	142.1 bps	20.0 bps	22	0	\$82,307
USD-MXN	34	\$15,590,100	24.0 bps	10.4 bps	34	0	\$21,101
USD-BRL	26	\$12,661,200	29.7 bps	15.0 bps	26	0	\$18,596
USD-EUR	20	\$33,896,600	12.0 bps	10.0 bps	20	0	\$6,803
USD-NGN	18	\$838,900	86.2 bps	70.0 bps	18	0	\$1,363
Total	120	\$69,727,500	31.4 bps	12.7 bps	120	0	\$130,171

A band marked *hold* contributes nothing to the saving: if your own price already beats the best venue we can reach at that size, the flow does not move and we do not claim it. The saving is the sum over the bands that actually change.

“live · measured” means the rate was read from that venue's own public API at the time stamped below, at the ticket sizes shown, and the maximum ticket is the largest size it could actually fill when we looked. “sourced” means the rate is the venue's own published schedule. “estimate” means the venue does not publish pricing and the figure is a stated mid-pack model. Treat those bands as directional until your desk has a real quote in hand.

How the bands were built

- **Executable, not theoretical.** Every instruction respects each venue's own minimum and maximum ticket. A split whose remainder would land under a desk's minimum is repaired: either that desk is sent its full minimum or it is dropped from the instruction, whichever prices better. Legs are rounded to round clips that still sum to the exact ticket.
- **A second venue has to earn its place.** A leg is only instructed if removing it would cost more than 0.5 bps of the ticket. A cost-minimal router will hang a \$1,000 tail on a \$7M ticket for a hundredth of a basis point; as an instruction that is a second settlement, a second reconciliation and a second thing that can fail, for nothing.
- **A band is a region, not a point.** Bands are grown from their own left edge and extended for as long as one instruction stays within 0.5 bps of the size-specific optimum, probing every venue limit inside the range, so a band can never quietly run past the maximum ticket of the venue it names.
- **Prices are the router's own.** A whole-ticket instruction is priced as one ticket at one venue, and a split leg is priced at the size it would be sent in. These are the same numbers our pre-trade router returns, not a separate model.

What we do and don't do. We quote, route and score. Your desk executes every trade on its own credentials and its own venue relationships. We never take custody of funds and never execute as your agent.
